Improved ZX
Diagrams

If we have a bit, we can simply check whether it is on or off.

Things become trickier if we want to check on superposition. If we touch the light switch, then it will collapse to either $|0\rangle$ or $|1\rangle$.

Things get even weirder with a qubit on the Bloch sphere! To see why, let us go back to the double slit experiment.

Double Slit Experiment Revisited

Measurement

Measurement

Dongho Lee

Measurement
and Collapse

Measurement in
Quantum
Computing

A Random
Number
Generator

Improved ZX
Diagrams

Goal

We will look at a brain scan and determine whether the tissue is cancerous.

In quantum computer, we could try to prepare a qubit that is closer to $|1\rangle$ when it is more likely the tissue is cancerous

Like a light switch, if the state is closer to $|1\rangle$, then it is more likely to collapse to $|1\rangle$ after measurement.

Example: Brain Scans and Quantum Computing

Measurement

Dongho Lee

Measurement
and Collapse

Measurement in
Quantum
Computing

A Random
Number
Generator

Improved ZX
Diagrams

Goal

We will look at a brain scan and determine whether the tissue is cancerous.

In quantum computer, we could try to prepare a qubit that is closer to $|1\rangle$ when it is more likely the tissue is cancerous

Like a light switch, if the state is closer to $|1\rangle$, then it is more likely to collapse to $|1\rangle$ after measurement.

By running the algorithm many times, likelihood can be estimated.

Measurement in Quantum Computing

We add a notation of a new gate to our circuits for quantum measurement.

Measurement in Quantum Computing

We add a notation of a new gate to our circuits for quantum measurement.

This gate turns a quantum wire (i.e., a qubit) into a conventional wire (i.e., a bit) which we illustrate by a pair of wires.

It is hard to generate random numbers in conventional computing.

In a quantum computer, the following generates a random number:

- 1 First, we will start with a qubit in state $|0\rangle$.
- 2 Then, we will apply a Hadamard gate to obtain a qubit in state $|+\rangle$.
- 3 Finally, we will measure the qubit to obtain a bit that is in state $|0\rangle$ half of the time, and in state $|1\rangle$ the other half.

This program corresponds to the following circuit.

Example: Explanation of the Generator

The circuit corresponds to the following pair of ZX-diagrams:

$$\begin{array}{l} \text{Diagram 1: } \text{Red circle } 0 \text{ --- } \boxed{H} \text{ --- } \text{Red oval } 0 \cdot \pi \\ \text{Diagram 2: } \text{Red circle } 0 \text{ --- } \boxed{H} \text{ --- } \text{Red oval } 1 \cdot \pi \end{array} = \begin{array}{l} \text{Diagram 3: } \text{Green circle } 0 \text{ --- } \text{Red oval } 0 \cdot \pi \\ \text{Diagram 4: } \text{Green circle } 0 \text{ --- } \text{Red oval } 1 \cdot \pi \end{array} = \begin{array}{l} \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} \end{array}$$

Example: Explanation of the Generator

The circuit corresponds to the following pair of ZX-diagrams:

$$\begin{array}{l} \text{Diagram 1: } \text{Red circle } 0 \text{ --- } \boxed{H} \text{ --- } \text{Red oval } 0 \cdot \pi = \text{Green circle } 0 \text{ --- } \text{Red oval } 0 \cdot \pi = \frac{1}{\sqrt{2}} \\ \text{Diagram 2: } \text{Red circle } 0 \text{ --- } \boxed{H} \text{ --- } \text{Red oval } 1 \cdot \pi = \text{Green circle } 0 \text{ --- } \text{Red oval } 1 \cdot \pi = \frac{1}{\sqrt{2}} \end{array}$$

As we saw earlier on, $|1/\sqrt{2}|^2 = 1/2$, so we will measure $|0\rangle$ one half of the time, and $|1\rangle$ the other half of the time.

Example: Explanation of the Generator

The circuit corresponds to the following pair of ZX-diagrams:

$$\begin{array}{l} \text{Diagram 1: } \text{red circle } 0 \text{ --- } \boxed{H} \text{ --- } \text{red oval } 0 \cdot \pi = \text{green circle } 0 \text{ --- } \text{red oval } 0 \cdot \pi = \frac{1}{\sqrt{2}} \\ \text{Diagram 2: } \text{red circle } 0 \text{ --- } \boxed{H} \text{ --- } \text{red oval } 1 \cdot \pi = \text{green circle } 0 \text{ --- } \text{red oval } 1 \cdot \pi = \frac{1}{\sqrt{2}} \end{array}$$

As we saw earlier on, $|1/\sqrt{2}|^2 = 1/2$, so we will measure $|0\rangle$ one half of the time, and $|1\rangle$ the other half of the time.

Not Just an Idea

We would like to emphasize that this is not just a cool theoretical idea. Indeed, people have already built random number generators based on this simple idea!

- If the measurement outcome is 0 , then it does not negate q .
- If the measurement outcome is 1 , then it negates q .

The second qubit q is rotated by $b \cdot \pi$ for each outcome b .
