A Sociological Example

Sometimes sociologists come up with rules for how people interact, which they then want to test out on a computer.

What are the possible states for a pair of bits?

Possible States: $|00\rangle$, $|01\rangle$, $|10\rangle$ and $|11\rangle$.

The controlled-NOT gate gets applied to each possible state, as if all four computations were happening at once!

$$|00\rangle \mapsto |00\rangle \quad |01\rangle \mapsto |01\rangle \quad |10\rangle \mapsto |11\rangle \quad |11\rangle \mapsto |10\rangle$$

However... We must perform a measurement to get an answer...
So, we only get one answer as the state collapses.
